

UMH-SANGO - remineralization filter for osmosis systems

- The UMH remineralization filter enriches osmosis water with minerals and trace elements and thus enables optimal subsequent energization.
- Increases the pH value of the water and enriches it with natural calcium, magnesium and another 70 trace elements. This improves the ability to energize and, above all, the cell availability of the treated water.
- Simple assembly directly after the osmosis system with John Guest connections
- This is followed by the assembly of the UMH Pure device**

Technical specifications:

Length in mm:	305
Ø in mm:	61
Flow rate l / min. Connections:	3
with JG connector Shelf life of the granulate:	1/4 " about 2 years
